

PRESS RELEASE

People with HIV are living longer but still face many challenges

Brussels, 7 December 2016: The substantial increase in life expectancy for people living with HIV (PLHIV) is a hugely important achievement. However, PLHIV continue to face significant health-related challenges which are in urgent need of attention from policy makers and the wider health community.

A new initiative, 'HIV Outcomes: Beyond Viral Suppression', today launched a campaign to highlight and address these challenges, which include co-existing physical and mental health conditions (that PLHIV are at higher risk of developing), and social inclusion – which continues to be undermined by stigma and discrimination.

The initiative, which features high profile patient representatives, clinicians, academics, and industry, wants health systems and HIV policy frameworks to take account of these diverse challenges, so that PLHIV gain access to the necessary health and support services in order to live long and well.

'HIV Outcomes: Beyond Viral Suppression' seeks to complement other HIV initiatives focusing on prevention, diagnosis and access to effective care, where there are global targets for the HIV response but much work remains to be done. The initiative also builds upon the WHO Global Health Sector Strategy on HIV, 2016-2021, which highlights the need for PLHIV to have access to chronic care, but does not provide specific objectives or targets in that area.

Speaking ahead of the launch event in Brussels today, Nikos Dedes, Co-Chair of the HIV Outcomes: Beyond Viral Suppression Steering Group, said: *"Current HIV policy was not conceived with ageing in mind, but living long term with HIV creates its own specific needs. The policy environment must adapt to recognise, measure and address these needs."*

Professor Jeffrey Lazarus of ISGlobal, Hospital Clínic at the University of Barcelona, is leading a study group composed of HIV and health system experts in order to assess the performance of health systems in addressing the challenges highlighted in this initiative. Lazarus presented an interim report at today's launch event.

The campaign comes at a watershed moment for HIV/AIDS policy with the EU's Action Plan set to expire at the end of this year. The Initiative seeks to encourage the European Commission to adopt a new integrated framework on HIV, viral hepatitis and tuberculosis that can provide a coordinated response to these threats. The Steering Group also wants to see the European monitoring framework on HIV (based on the 2004 Dublin Declaration) expanded to reflect new and ongoing health and social needs of PLHIV.

Notes for editors:

The Beyond Viral Suppression initiative arises out of a shared recognition among leading HIV experts that there are crucially important issues relating to the health and social inclusion of PLHIV that have to date received insufficient attention from policy makers and healthcare providers, and which must now form part of the HIV response. The steering group is co-chaired by: **Nikos Dedes**, the Founder of Positive Voice (the Greek association for PLHIV) and a Board member of the European AIDS Treatment Group (EATG); Professor **Jane Anderson** of Homerton University Hospital NHS Foundation Trust in London; and Professor **Jeffrey Lazarus** of ISGlobal, Hospital Clínic at the University of Barcelona, and CHIP, Rigshospitalet, University of Copenhagen. The initiative is enabled by sponsorship provided by Gilead Sciences and ViiV Healthcare.
